Age specific survival workflow for local execution

June 2014

Capacities Programme of Framework 7: EC e-Infrastructure Programme –
e-Science Environments - INFRA-2011-1.2.1

Grant Agreement No: 283359
Project Co-ordinator: Mr Alex Hardisty
Project Homepage: http://www.biovel.eu
Duration of Project: 36 months
Age specific survival workflow for local execution
Age specific survival workflow for local execution

1 Description

The age-specific survival analysis workflow gives the basic information on the mean, variance and coefficient of variation (cv) of the time spent in each stage class and the mean and variance of the time to death.

Analyses:

- Fundamental matrix (N)
- Variance (var)
- Coefficient of variation (CV)
- Meaneta
- Vareta

2 General

2.1 Name of the workflow in myExperiment.

Name: Age specific survival workflow for local execution.

Download: The pack can be downloaded at myExperiment under the following address: http://www.myexperiment.org/packs/631.html or the workflow at: http://www.myexperiment.org/workflows/3286.html

2.2 Date, version and licensing

Last updated: 2\textsuperscript{nd} November 2012

Version: 1

Licensing: CC-BY-SA

2.3 How to cite this workflow

To report work that has made use of this workflow, please add the following credit acknowledgement to your research publication:

The input data and results reported in this publication (tutorial) come from data (Dr. Gerard Oostermeijer unpublished results and publication: Oostermeijer, J.G.B. M.L. Brugman, E.R. de Boer; H.C.M. Den Nijs. 1996. Temporal and Spatial Variation in the Demography of \textit{Gentiana pneumonanthe}, a

3. Scientific specifications

3.1 Keywords

Matrix Population Models, Age specific survival, Fundamental matrix (N), Variance (var), Coefficient of variation (cv), Meaneta, Vareta.

3.2 Scientific workflow description

The age-specific survival analysis workflow gives the basic information on age-specific survival; this includes the mean, variance and coefficient of variation (CV) of the time spent in each stage class and the mean and variance of the time to death.

The aim of the age-specific survival analysis workflow is to provide a connected environment to calculate the mean, variance and coefficient of variation (CV) of the time spent in each stage class and the mean and variance of the time to death. The workflow accepts input data in a .txt format. The output is provided as a set of R results.

a) Fundamental matrix (N): is the mean of the time spent in each stage class.

b) Variance (var): is the variance in the amount of time spent in each stage class.

c) Coefficient of variation (CV): is the coefficient of variation of the time spent in each class (SD/mean- the ratio of the standard deviation to the mean).

d) Meaneta: is the mean of time to death, of life expectancy of each stage.

e) Vareta: is the variance of time to death.

Figure 1. Age-specific survival analysis workflow in Taverna workbench.

For more detailed description of the functions, please visit the Tutorial section.
Age specific survival workflow for local execution

4 Technical specifications

4.1 Execution environment and installation requirements

The Workflow requires a Taverna Engine. The simplest way to install a Taverna Engine is to install Taverna Workbench. The workflow also requires an Rserve installation with popdemo package installed. It is possible to setup the workflow to use a remote Rserve. However, instructions for installing a local Rserve are provided below.

4.2 Taverna installation, including updates and plugins

4.2.1 Taverna installations

- Taverna Workbench: Version 2.4 or 2.5. For installation files and instructions, please go to http://www.taverna.org.uk/download/workbench

4.2.2 Taverna Dependencies

- Install R software in your computer. See: http://www.r-project.org/
- Start R, and install package Rserve:
  - install.packages("Rserve")
- Install package popbio
  - install.packages("popbio")
- Local R Server: (Rserve) running at port 6311. See https://wiki.biovel.eu/x/3ICD for additional information.

4.2.3 How it works

- First, open R, once R is opened, type library(Rserve) and press enter; then type Rserve() and press enter again. You will see then the following message: Starting Rserve...

  "C:\PROGRA~1\IR\IR-30~1.1\library\Rserve\libs\x64\Rserve.exe"

After this operation you can open Taverna and run the workflow.
# 5 Tutorial

## 5.1 Introduction

In this tutorial, you will use an input file MTers87_88.txt, called in myexperiment.org: Stage Matrix of *Gentiana pneumonanthe* 1987-88 File. You will use this file to perform the age specific survival on it. Finally you will be able to export your results to different formats.

## 5.2 Input data.

### 5.2.1 Data preparation/format

The workflow accepts input data (matrices) in a .txt format, all decimal numbers in each matrix must be indicated by dots e.g.: 0.578. The example matrix for the tutorial is available in: [http://www.myexperiment.org/files/1135.html](http://www.myexperiment.org/files/1135.html) or here below.

### 5.2.2 Input data

The input files are in a .txt format: to download click here in each file:

- **Terschelling**
  - MTers87_88.txt

Example from:

Please note that the workflow as well as the tutorial is a beta version, and may contain errors. We hope you will still find it interesting to work with this workflow, and look forward to your feedback.

## 5.3 Select input data dialogue boxes.

The first step is to fill out the input ports:

### 5.3.1 INPUTPORTS

1. **columns_fecundity**: the column(s) in which the fecundity values are found, should be selected.

In the example of the *Gentiana* species (Oostermeijer et al. 1996. *Journal of Ecology*): The selected column is G (reproductive individuals), the number 4 will be used to

<table>
<thead>
<tr>
<th></th>
<th>S</th>
<th>J</th>
<th>V</th>
<th>G</th>
<th>D</th>
</tr>
</thead>
<tbody>
<tr>
<td>S</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>7,666</td>
<td>0</td>
</tr>
<tr>
<td>J</td>
<td>0.0579</td>
<td>0.01</td>
<td>0</td>
<td>8,5238</td>
<td>0</td>
</tr>
<tr>
<td>V</td>
<td>0.4637</td>
<td>0.83</td>
<td>0.9009</td>
<td>0.2857</td>
<td>0.8604</td>
</tr>
<tr>
<td>G</td>
<td>0</td>
<td>0.04</td>
<td>0.009</td>
<td>0.619</td>
<td>0.1162</td>
</tr>
<tr>
<td>D</td>
<td>0</td>
<td>0.03</td>
<td>0.018</td>
<td>0</td>
<td>0.0232</td>
</tr>
</tbody>
</table>
identify the fecundity column (G) (see matrix next to text).

The numbers of the reproductive columns must be added one by one (in the case that there is more than one reproductive column. In this example there is only one). First press add value, fill the number of the column and press enter, then press add value and fill once again the next reproductive column, repeat the action until you have fill all the numbers of all reproductive columns (Fig 2).

e.g.: 4

2) rows_fecundity: the row(s) in which the recruitment values are found, should be selected.

In the example of the Gentiana species (Oostermeijer et al. 1996. Journal of Ecology): Selected rows are S and J (seedlings and juveniles; these stages receive recruits each year from the stage G); therefore, the numbers 1 and 2 are used to identify these rows (see matrix next to the text).

The numbers of the stages that receive recruits each year from the stage G must be added one by one (in the case that there are more than one recruit stage row). First press add value, fill the number of the row and press enter, then press add value and fill once again the next recruit stage row, repeat the action until you have fill all the numbers of all recruits rows (Fig. 3).

e.g.: 1 and 2
Age specific survival workflow for local execution

Figure 3. The number(s) of the recruit(s) row(s) to be filled in.

3) **stage matrix file**: Stage matrix in a .txt file format. Click in Set file location (red arrow in Fig 4), a window dialog appears and the user selects the file (e.g. **MTers87_88.txt**, Fig 5) and then clicks the Open button. Then the link to the file will appear on the Taverna window.

Figure 4. Set the Location of the matrix file.
Figure 5. Choose the matrix file and click in Open.

4) **stages**: Here come the names of the stages or categories of the input matrix. No longer than 8 characters.

In the following example, the matrix has 5 stages or categories:

e.g. the stages of this matrix are called:

<table>
<thead>
<tr>
<th></th>
<th>S</th>
<th>J</th>
<th>V</th>
<th>G</th>
<th>D</th>
</tr>
</thead>
<tbody>
<tr>
<td>S</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>7,666</td>
<td>0</td>
</tr>
<tr>
<td>J</td>
<td>0,0579</td>
<td>0,01</td>
<td>0</td>
<td>8,5238</td>
<td>0</td>
</tr>
<tr>
<td>V</td>
<td>0,4637</td>
<td>0,83</td>
<td>0,9009</td>
<td>0,2857</td>
<td>0,8604</td>
</tr>
<tr>
<td>G</td>
<td>0</td>
<td>0,04</td>
<td>0,009</td>
<td>0,619</td>
<td>0,1162</td>
</tr>
<tr>
<td>D</td>
<td>0</td>
<td>0,03</td>
<td>0,018</td>
<td>0</td>
<td>0,0232</td>
</tr>
</tbody>
</table>

The name of stages or categories must be added one by one. First press add value, fill the name of the stage no longer than 8 characters and press enter; then press add value and fill once again the next name of the stage; repeat the action until you have fill all the names of all stages (Fig 6).
Age specific survival workflow for local execution

Figure 6. The name of the stages to be filled in.

After the user has filled out the input ports and has clicked the Run Workflow button, the workflow performs the analysis. To complete all the analysis may take few seconds.

When the analyses are completed, they appear on a different window under results in Taverna, the user have to save each output separately.
5.4 Save data/results

5.4.1 OUTPUTS

First, click in the selected result window **Age_specific_survival** (Fig 7). Second, click in the left window on value 1 (blue oval), Third, on the right window click on the save value (red oval). Fourth, name the file and determinate the extension file. For a text file: e.g. .csv or .txt. (Fig 8), Finale, save the file in the chosen map.

**Figure 7.** Age_specific_survival output window. Save value on the right window of the Age_specific_survival output results.

**Figure 8.** Name the file and determinate the extension file. For a text file: e.g. .csv or .txt.
**Age specific survival**

The age specific survival workflow gives the basic information on age-specific survival (Fig 9):

11) **Fundamental matrix (N)**: is the mean of the time spent in each stage class. E.g.: For our *Gentiana* example means a J plants will spends, on average, about 1 year as a Juvenile, 11 as vegetative plant, less than a year a reproductive and dormant plant.

12) **Variance (var)**: is the variance in the amount of time spent in each stage class.

13) **Coefficient of variation (CV)**: is the coefficient of variation of the time spent in each class (SD/mean-the ratio of the standard deviation to the mean).

14) **Meaneta**: is the mean of time to death, of life expectancy of each stage. E.g. The mean age at death is the life expectancy; the life expectancy of a new individual seedling is 8 years.

15) **Vareta**: is the variance of time to death.

Figure 9. *Age specific survival* opens in excel.

7.1.2 Project funding

The workflow described in this documentation has been designed and implemented as part of the BioVeL project.

BioVeL is funded by the European Commission 7th Framework Programme (FP7) as part of its e-Infrastructures activity. Under FP7, the e-Infrastructures activity is part of the Research Infrastructures programme, funded under the FP7 'Capacities' Specific Programme. It focuses on the further development and evolution of the high-capacity and high-performance communication network (GÉANT), distributed computing infrastructures (grids and clouds), supercomputer infrastructures, simulation software, scientific data infrastructures, e-Science services as well as on the adoption of e-Infrastructures by user communities.
